

# Canary Works!

## for PHP

Years ago, miners took birds with them into the mines to detect unsafe air conditions. If the bird became sick, the miners knew to leave the mine immediately. That's exactly what Canary Works! for PHP applications can do for web site administrator --provide immediate warning if code is compromised by a virus.

The web is full of malicious bots that are constantly looking for security holes that allow them to insert their code into a web site. Visitors to an infected site are quietly bombarded with a battery of virus attacks exploiting known vulnerabilities. The first virus to get through opens a window for subsequently more severe infection. Many of these viruses are not so much interested in destroying your computer as they are in stealing information that has economic value. They cause annoying pop ups and redirects to web sites that entice you to buy things or give up personal information, like credit card numbers. They also steal your FTP password.

If this happens to you, Canary Works! for PHP will immediately detect that your web scripts--HTML, Javascript, or PHP have been changed and it will display a short message indicating the problem and shut the script down--preventing the spread of the virus to your client computers. You have the option of receiving an e-mail message alerting you to the discovery so you can take corrective action immediately. It can also protect other content like .pdf or .jpg files.

Canary Works! for PHP will work with many different coding styles and there are a number of features that are user selectable during installation. Best of all, Canary Works! for PHP is free. We'd love to just post the software [here](#) and let everyone have it. But then the code might fall into the hands of the bad guys, who would find a vulnerability to exploit and then it wouldn't work so well. So we're kind of picky about who we give the software too, and we prefer to stay hands during installation to adapt it to each clients unique requirements and verify its installed correctly. Feel free to call or e-mail us for more information, and when you're ready to protect your web site--get Canary Works! because it does!
